LINEAR GUIDE

SAIBO
Innovation in Motion

SAIBO is one of world recognized manufacturers of precision power transmission components. SAIBO group has two divisions, linear motion division and bearing division. Linear Product Division mainly produces curved rail and conveyor, telescopic rail and fork, linear guide, linear module, belt conveyor etc. Bearing Division mainly produces Thin-section bearing, High-speed angular contact ball bearing, linear bearing etc.

SAIBO products are widely used in 3C, factory automation, precision machine, green energy, rail transportation, medical and pharmacy etc. industries. SAIBO end users are located in more than 50 countries and regions around the world.

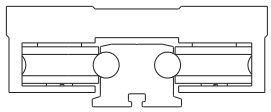
SAIBO has over 33,000 square meters producing facilities totally and 350 employees. SAIBO continues to develop innovative automation components and modulars to meet customers sustainable solutions.

SAIBO means aim for greatness, focus on details. We seek to work with you and promise the following:

- The right product from your application
- A quality product you can trust
- Engineering assistance that is proven and world renown

SNIBO
Innovation in Motion

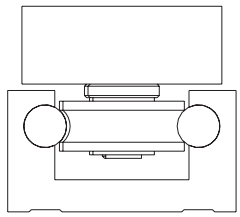
INDEX



LGA Roller Type Linear Guide (Aluminum Rail Body)

Two steel shafts are assembled external aluminum rail body. Rollers realize high speed, low noise. Carriages are sealed with good dust–protect performance.

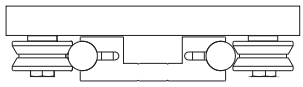
P1—P6



LGB Roller Type Linear Guide (Aluminum Rail Body)

Two steel shafts are assembled internal aluminum rail body. Carriage is narrow and suitable for compact applications. Rollers realize high speed, low noise.

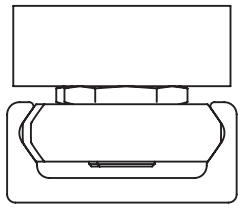
P7—P12



LGC Roller Type Linear Guide (Aluminum Rail Body)

LGC rail adopt wide–body structure and big diameter shafts to realize heavy load capacity and good rigidity.

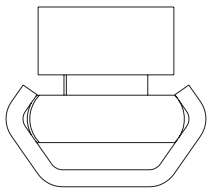
P13—P18



TV Roller Type Linear Guide (Steel Rail)

Rail is made of Cold–drawn steel profile with hardened raceways. Suitable for heavy load, compact structure applications

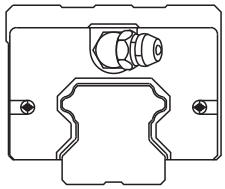
P19—P26



TE Roller Type Linear Guide (Steel Rail)

The series guide rail has a large working range, and still has good reliability in dirty environment.

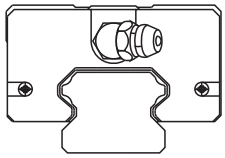
P27—P33



HG Steel Ball Type Linear Guide

Steel balls circulate in four–rows raceways. Heavy load capacity, high accuracy.

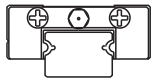
P35—P40



EG Steel Ball Type Linear Guide

EG linear guide has same structure with HG but the assembly height is lower. Suitable for medium and heavy load capacity, high accuracy and compact space applications.

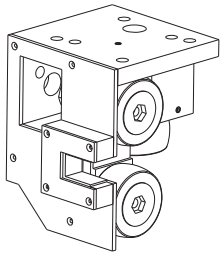
P41—P45



MG Steel Ball Type Linear Guide (Miniature)

Miniature linear guide is designed with two–rows raceways. Suitable for light load and miniaturized equipment.

P47—P51



HV Heavy load linear Guide

The series guide rails and rollers are hardened, with high precision, stable performance and low friction.Especially suitable for heavy loads.

P53—P63

SNIBO
Innovation in Motion

LGA Roller Type Linear Guide

Construction

LGA linear guide systems are mainly made of lightweight aluminum alloy. Four rollers inside the carriage run on railway's hardened shafts. Stable rolling movement are particularly suitable for use in material handling system and automatic production lines.

Railway

Anodized aluminum alloy body with two hardened and chrome-plated steel shafts

Carriage

Anodized aluminum alloy plate

4 pieces double row balls bearings(Rollers)

2 pieces concentric bolts and 2 pieces eccentric bolts

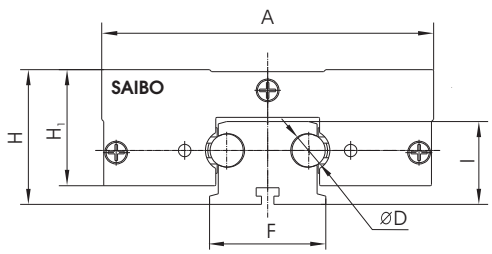
2 pieces plastic lubrication cover with oil soaked felt wipers

Feature

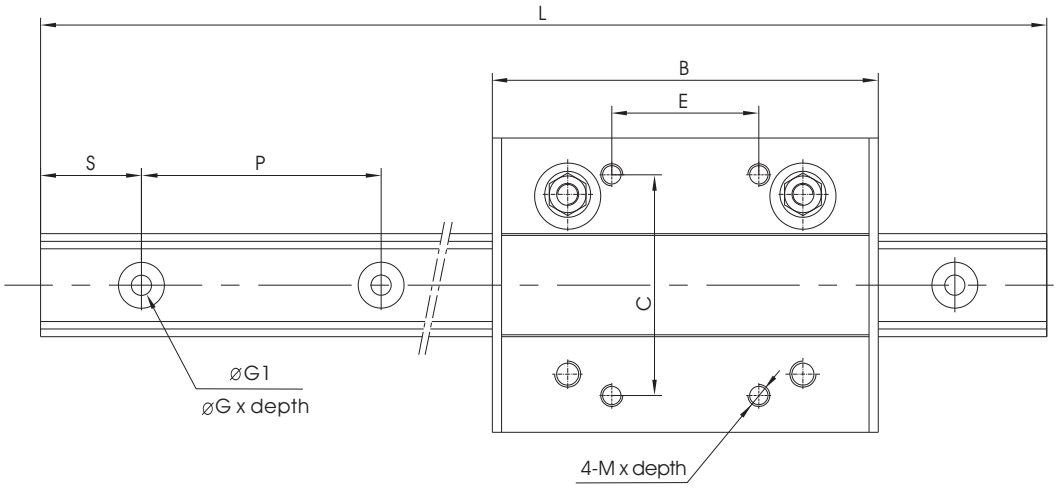
1.High speed, Low friction and Low noise

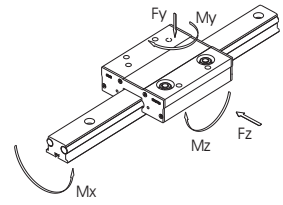
2.Preload is adjustable

3.Sealed and Lubricated



Type	Assembly Dimensions		Carriage Dimensions							
	H	F	A	B	C	E	H_1	M x depth	D	G x depth
LGA25	32.5	28	80	105	60	40	28	M6x8	8	12.5x5.5
LGA30	38.5	34.2	100	120	85	50	33	M8x10	10	14.5x6.5





Railway Dimensions					Max Load capacity(N)		Max moment capacity(N·m)		
G_1	I	S	P	Lmax*	Fymax	Fzmax	Mxmax	Mymax	Mzmax
5.5	20	25	50	3000	520	1200	7.6	26	15
6.5	24	25	50	4000	1200	4000	26	78	45

Setting clearance - free

None clearance is necessary for system's rigidity and stability. LGA series use 2 concentric bolts on one side in the direction of railway and 2 eccentric bolts on the other side. These two eccentric bolts are used for setting clearance-free.

1. Tighten concentric bolts.

2. Tighten the eccentric bolts to near the critical point, but not reach the critical point. (This is to rotate the eccentric bolts).

3. Rotate the eccentric bolts with straight screwdriver at the end of the stud to adjust the clearance. Adjust the clearance to zero.

4. Slide the carriage by hand and adjust to the extent where there causes a slight slipping resistance.

5. Keep eccentric bolt's position and tighten the nut.

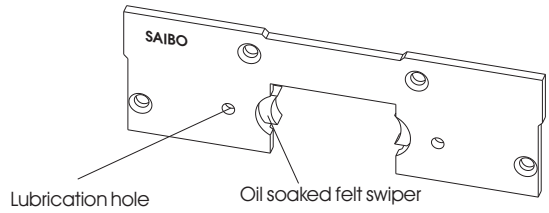
Setting Pre-load

It is same as Setting clearance-free. First adjust clearance to zero, continue rotating eccentric bolts will get pre-load. Appropriate pre-load should be decided according to the application.

Over pre-load will decrease system's life. Please be careful.

Lubrication

Plastic lubrication cover contains oil soaked felt wipers which can be re-lubricated via lubrication holes.



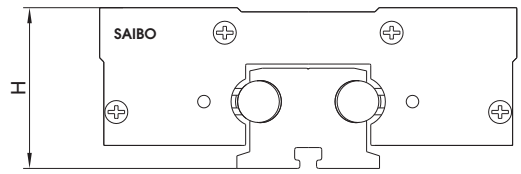
Working parameter

Max speed: 10m/s

Max acceleration: 50m/s^2

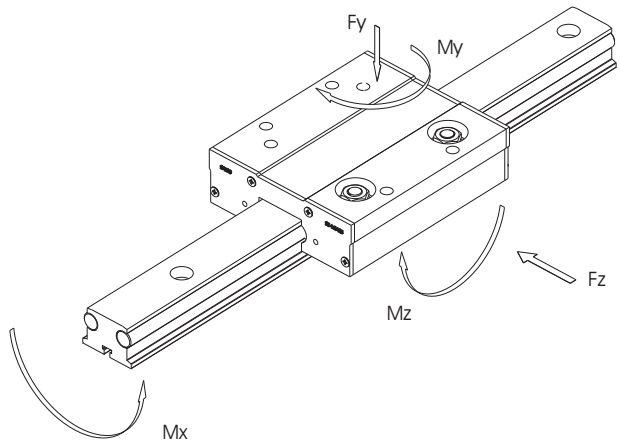
Working temperature: −20°C ~ +80°C

Accuracy



Load / life calculation

Due to the hardness of the railway's shaft and fatigue analysis of railway and roller, the railway's life does not determine the system life. It is determined by roller's life. System's life varies by actual combination of load, working status and environment conditions etc. So loading factor should be calculated firstly. Then system's life could be calculated via using below formula.



LF - Loading factor

(LF should be less than 1.0 for any combination of load)

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$

LF - Loading factor

Fy - Actual load in Y direction. (N)

Fz - Actual load in Z direction. (N)

Mx - Actual moment in X direction. (N.m)

My - Actual moment in Y direction. (N.m)

Mz - Actual moment in Z direction. (N.m)

Below parameters can be taken from the table of Load capacity.

Fy max - Max load capacity in Y direction. (N)

Fz max - Max load capacity in Z direction. (N)

Mx max - Max moment capacity in X direction. (N·m)

My max - Max moment capacity in Y direction. (N·m)

Mz max - Max moment capacity in Z direction. (N·m)

Life calculation

SAIBO designed LGA series load capacity according to basic life of 100km for each type. System's life in km could be calculated via below formula.

$$Life(km) = \frac{100}{(0.03+0.97LF*f)^3}$$

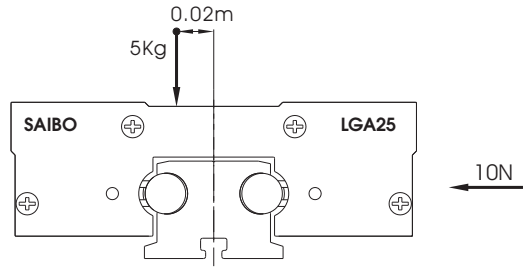
Tolerance H: ±0.20mm

f - Reduction coefficient of the application and environment.

None vibration or shock, Low speed (<1m/s), Low frequency shift direction, clean environment.	1-1.5
Light vibration or shock, medium speed (1-2.5m/s) medium frequency shift direction, some dirtiness	1.5-2
Heavy vibration or shock, high speed (>2.5m/s) high frequency shift direction, heavy dirty	2-3.5

Calculation example

Here select SB-LGA25 as calculation example. This system is loaded as below picture. Working condition is clean and there is no vibration or shock.



The load factor LF is calculated use formula

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$

Fy = 5 kg x 9.8 (gravity) = 49 N

Fz = 10 N

Mx = 49 x 0.02 = 0.98 N.m

My = 0

Mz = 0

Take parameters Fy max, Fz max, Mx max, My max, Mz max from table and then fill in the formula

$$LF = \frac{49}{520} + \frac{10}{1200} + \frac{0.98}{7.60} + \frac{0}{Mymax} + \frac{0}{Mzmax} = 0.2314$$

According to the description of working condition, take f=1.1

$$Life(km) = \frac{100}{(0.03+0.97LF*f)^3}$$

$$= \frac{100}{(0.03+0.97*0.2314*1.1)^3}$$

$$= 4716km$$

LGB Roller Type Linear Guide

Construction

LGB linear guide systems are designed for compact space application. The carriages are in narrow structures. Railway, narrow carriage and lubrication cover are its basic construction.

Railway

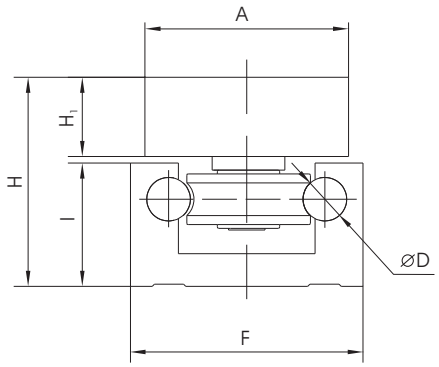
Anodized aluminum alloy body with two hardened and chrome-plated steel shafts

Carriage

Anodized aluminum alloy plate
3 pieces double row balls bearings(Rollers)
Eccentric bolt used for adjust the clearane/preload
Optional lubrication covers with oil soaked felt wipers

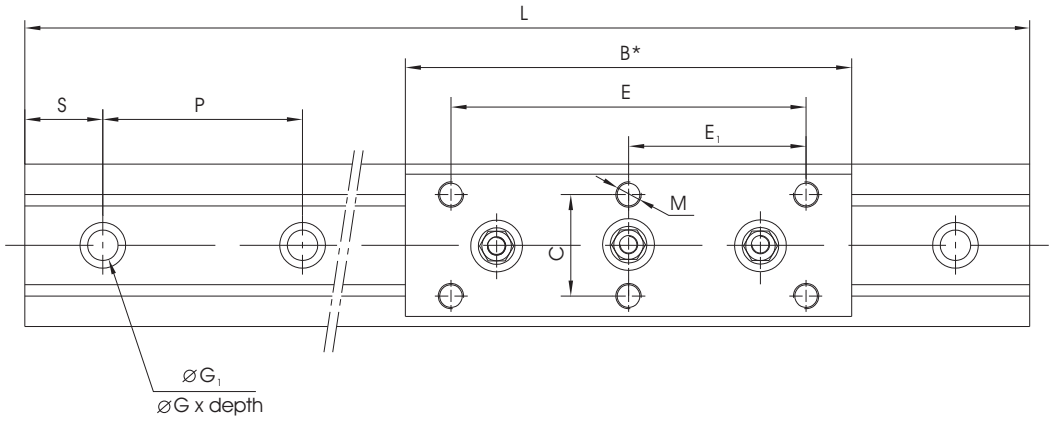
Feature

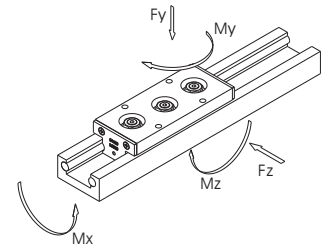
1. High speed, Low friction and Low noise
2. Preload is adjustable
3. Narrow body for compact application
4. Optional Lubrication covers



Type	Assembly Dimensions		Carriage Dimensions								
	H	F	A	B*	C	E	E_1	H_1	M	D	G x depth
LGB15	28.8	32	28	88	20	70	–	10.9	4xM5	6	7.5x2.5
LGB20	35.5	47	47	108	38	50	–	11.5	4xM6	8	9.5x5
LGB25	43	65	64	150	47	130	65	14.7	6xM8	10	11x4

* This size does not include plastic cover's thickness. All size plastic cover's thickness is 2.5mm. So covered carriages' length must add 5.0mm to size B.





Railway Dimensions					Max Load capacity(N)		Max moment capacity(N·m)		
G_1	I	S	P	Lmax	Fymax	Fzmax	Mxmax	Mymax	Mzmax
4.5	17	30	60	3000	330	1000	1.8	12	5.5
5.5	21.75	30	60	3000	520	1200	6.6	45	15
6.5	26.5	30	60	3000	1200	4000	19	120	50

Setting clearance - free

None clearance is necessary for system's rigidity and stability. LGB series carriage has two concentric bolts on both sides and one eccentric bolt in the center along the railway. This eccentric bolt is used for setting clearance-free.

1. Tighten concentric bolts.

2. Tighten the eccentric bolt to near the critical point, but not reach the critical point. (This is for rotate the eccentric bolts).

3. Rotate the eccentric bolts with internal hexagonal wrench in the end of the eccentric bolt to adjust the clearance. Adjust the clearance to zero.

4. Slide the carriage by hand and adjust to the extent where there causes a slight slipping resistance.

5. Keep eccentric bolt's position and tighten the nut.

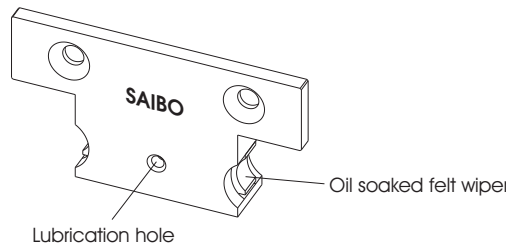
Setting Pre-load

It is same as Setting clearance-free. First adjust clearance to zero, continue rotating eccentric bolt will get pre-load. Appropriate pre-load should be decided according to application.

Over pre-load will decrease system's life. Please be careful.

Lubrication

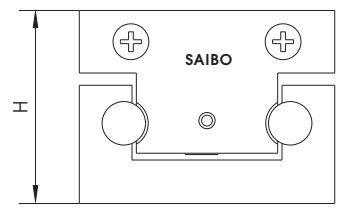
Plastic lubrication cover contains oil soaked felt wipers which can be re-lubricated via lubrication hole. This lubrication cover is optional, not included in standard carriage.



Working parameter

Max speed: 10m/s
Max acceleration: 50m/s^2
Working temperature: −20°C ~ +80°C

Accuracy

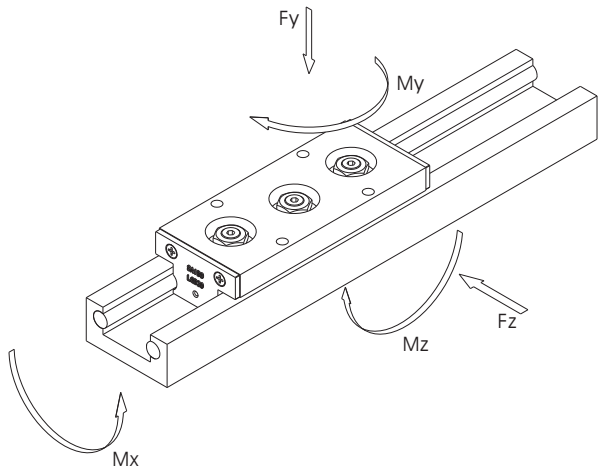


Tolerance H： ±0.20mm

Note: Higher accuracies are available upon request.

Load / life calculation

Due to the hardness of the railway's shaft and fatigue analysis of railway and roller, the railway's life does not determine the system life. It is determined by roller's life. System's life varies by actual combination of load, working status and environment conditions etc. So loading factor should be calculated firstly. Then system's life could be calculated via using below formula.



LF - Loading factor

(LF should be less than 1.0 for any combination of load)

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$

LF - Loading factor

Fy - Actual load in Y direction. (N)

Fz - Actual load in Z direction. (N)

Mx - Actual moment in X direction. (N.m)

My - Actual moment in Y direction. (N.m)

Mz - Actual moment in Z direction. (N.m)

Below parameters can be taken from the table of Load capacity.

Fy max - Max load capacity in Y direction. (N)

Fz max - Max load capacity in Z direction. (N)

Mx max - Max moment capacity in X direction. (N·m)

My max - Max moment capacity in Y direction. (N·m)

Mz max - Max moment capacity in Z direction. (N·m)

Life calculation

SAIBO designed LGB series load capacity according to basic life of 100km for each type. So after customers designed system's actual load, system's life could be calculated via below formula.

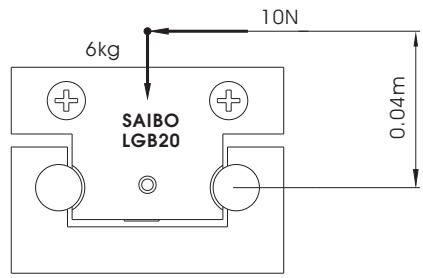
$$Life(km) = \frac{100}{(0.03+0.97LF*f)^3}$$

f - Reduction coefficient of the application and environment.

None vibration or shock, Low speed (<1m/s), Low frequency shift direction, clean environment.	1-1.5
Light vibration or shock, medium speed (1-2.5m/s) medium frequency shift direction, some dirtiness	1.5-2
Heavy vibration or shock, high speed (>2.5m/s) high frequency shift direction, heavy dirty	2-3.5

Calculation example

Here select SB-LGB20 as calculation example. This system loaded as blow picture. Working condition is clean and there is no vibration or shock.



The load factor LF is calculated use formula

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$

Fy = 6 kg x 9.8 (gravity) = 58.8 N

Fz = 10 N

Mx = 10 x 0.04 = 0.40 N.m

My = 0

Mz = 0

Take parameters Fy max, Fz max, Mx max, My max, Mz max from table and then fill in the formula

$$LF = \frac{58.8}{520} + \frac{10}{1200} + \frac{0.40}{6.60} + \frac{0}{Mymax} + \frac{0}{Mzmax} = 0.182$$

According to the description of working condition, take f=1.1

$$Life(km) = \frac{100}{(0.03+0.97LF*f)^3}$$

$$= \frac{100}{(0.03+0.97*0.182*1.1)^3}$$

$$= 8849 \text{ km}$$

LGC Roller Type Linear Guide

Construction:

LGC railway is wide structure. This linear guide can be used to replace the system built with two railways and has big load capacity and moment capacity. Especially the moment load is much bigger as two shafts' span is big.

Although railway's width is big, light-weight aluminum alloy still keep railway's weight light. In the body of the railway, there is a big U-shape groove. This groove is used for installing driven parts such as rack and gear, timing belt.

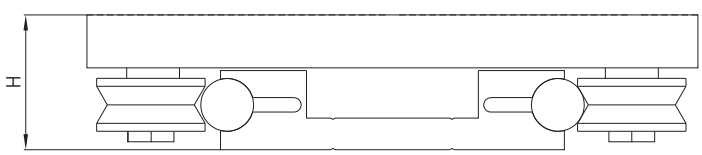
Feature:

1.High speed, Low friction and Low noise
2.Big load capacity and moment capacity
3.Pre-load is adjustable
4.Accurate and stable

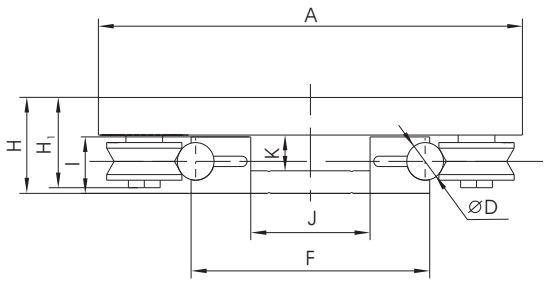
Working parameter

Max speed: 10m/s
Max acceleration: 50m/s^2
Working temperature: −20°C ~ +80°C

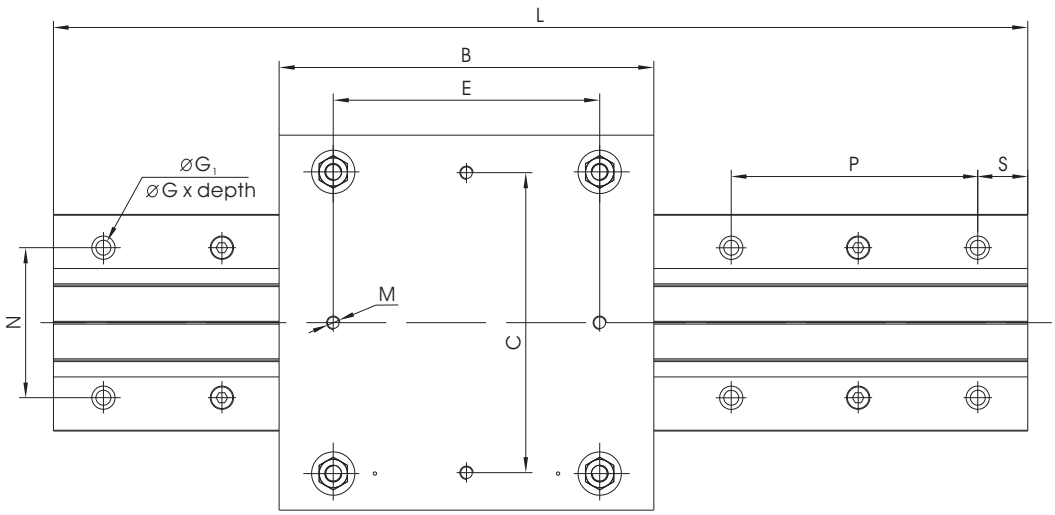
Accuracy

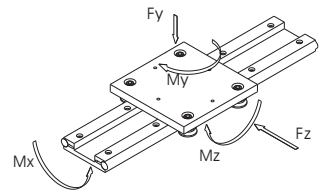


Tolerance H: ± 0.20mm
Note: Higher accuracies are available upon request.



Type	Assembly Dimensions		Carriage Dimensions								
	H	F	A	B	C	E	H_1	M	D	G x depth	G_1
LGC100	51	99	200	200	140	140	48	4-M8	20	14x5.5	9
LGC130	51	130	230	230	180	160	48	4-M8	20	14x5.5	9





Railway Dimensions							Max Load capacity(N)		Max moment capacity(N·m)		
I	J	K	N	S	P	Lmax	Fymax	Fzmax	Mxmax	Mymax	Mzmax
30	40	18	62	30	300	6000	6000	6000	190	210	210
30	65	18	90	30	300	6000	6000	6000	240	240	240

Setting clearance - free

None clearance is necessary for system's rigidity and stability. LGC series use 2 concentric bolts one side in the direction of railway and 2 eccentric bolts on the other side. These two eccentric bolts are used for setting clearance-free.

1. Tighten concentric bolts.

2. Tighten the eccentric bolts to near the critical point, but not reach the critical point. (This is to rotate the eccentric bolts).

3. Rotate the eccentric bolts with wrench at the end of the stud to adjust the clearance. Adjust the clearance to zero.

4. Slide the carriage by hand and adjust to the extent where there causes a slight slipping resistance.

5. Keep eccentric bolt's position and tighten the nut.

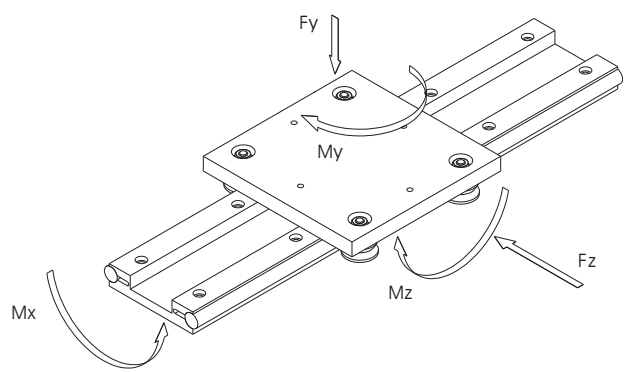
Setting Pre-load

It is same as Setting clearance-free. First adjust clearance to zero, continue rotating eccentric bolts will get pre-load. Appropriate pre-load should be decided according to application.

Over pre-load will decrease system's life. Please be careful.

Load / Life calculation

Due to the hardness of the railway's shaft and fatigue analysis of railway and roller, the railway's life does not determine the system life. It is determined by roller's life. System's life varies by actual combination of load, working status and environment conditions etc. So loading factor should be calculated firstly. Then system's life could be calculated via using below formula.



Working parameter

Max speed:	10m/s
Max acceleration:	50m/s^2
Working temperature:	−20°C ~ +80°C

LF - Loading factor

(LF should be less than 1.0 for any combination of load)

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$

LF - Loading factor

Fy - Actual load in Y direction. (N)

Fz - Actual load in Z direction. (N)

Mx - Actual moment in X direction. (N.m)

My - Actual moment in Y direction. (N.m)

Mz - Actual moment in Z direction. (N.m)

Below parameters can be taken from the table of Load capacity.

Fy max - Max load capacity in Y direction. (N)

Fz max - Max load capacity in Z direction. (N)

Mx max - Max moment capacity in X direction. (N·m)

My max - Max moment capacity in Y direction. (N·m)

Mz max - Max moment capacity in Z direction. (N·m)

Life calculation

SAIBO designed LGC linear guide load capacity according to basic life of 100km. System's life in km could be calculated using below formula.

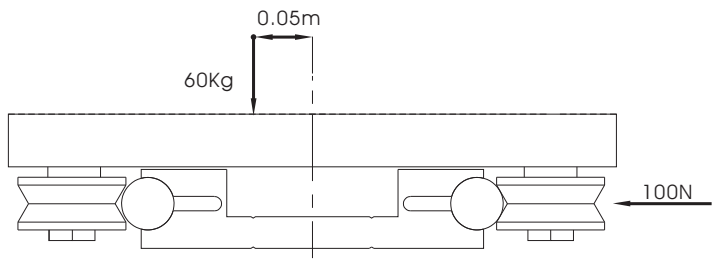
$$Life(km) = \frac{100}{(0.03+0.97LF*f)^3}$$

f - Reduction coefficient of the application and environment.

None vibration or shock, Low speed (<1m/s), Low frequency shift direction, clean environment.	1-1.5
Light vibration or shock, medium speed (1-2.5m/s) medium frequency shift direction, some dirtiness	1.5-2
Heavy vibration or shock, high speed (>2.5m/s) high frequency shift direction, heavy dirty	2-3.5

Calculation example

Here we select a load example to calculate the life. Sample's load is as below picture. Working condition is clean and there is no vibration or shock.



The load factor LF is calculated use formula

$$LF = \frac{Fy}{Fymax} + \frac{Fz}{Fzmax} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax}$$

Fy = 60 kg x 9.8 (gravity) = 588 N

Fz = 10 N

Mx = 588 x 0.04 = 29.4 N.m

My = 0

Mz = 0

Take parameters Fy max, Fz max, Mx max, My max, Mz max from table and then fill in the formula

$$LF = \frac{588}{6000} + \frac{100}{6000} + \frac{29.4}{240} + \frac{0}{Mymax} + \frac{0}{Mzmax} = 0.2372$$

According to the description of working condition, take f=1.1

$$\text{Life(km)} = \frac{100}{(0.03+0.97LF*f)^3}$$

$$= \frac{100}{(0.03+0.97*0.2372*1.1)^3}$$

$$= 4405 \text{ km}$$

TV Roller Type Linear Guide

Construction

TV rail matches roller slider could achieve high-speed, high acceleration, low noise. Lubricate felt wipers provides cleaning and lubrication. According to load capacity, carriage could be set more than 3 rollers.

Rail

Rail is made of high-quality Cold-drawn steel with induction hardened raceways. So it performs good rigidity, excellent wear-resisting property. Various surface treatment is optional for resisting corrosion.

Carriage

Carriage body is made of high strength aluminium alloy. Precision rollers set in concentric and eccentric according to different load capacities.

Feature

High load capacity, good rigidity performance
Low friction, excellent wear-resisting property
High speed and acceleration
Rails are easy to joint for long length

Running Parameter

Max. speed
Size 28: 5m/s
Size 35: 6m/s
Size 43: 7m/s
Max. Acceleration: 15m/s^2

Preload Setting

Eliminating the gap between the slider and the rail helps to improve the rigidity and stability of the system. The preload adjustment of the TV guide is relatively easy. The method is as follows:

1. First, mount the concentric rollers onto the slider base and lock it with the following hexagonal chuck wrench and inner hex wrench.

2. In the same way, mount the eccentric roller onto the slider base. Fixing the screw to tighten slightly but not lock.

3. Hold the position of the inner hex wrench by one hand. And turn the hexagonal chuck wrench slightly in the other hand, turning the eccentric shaft. Adjust the gap between the rail and the slider. In the meanwhile, move the slider until feel a slight resistance.

4. Hold the position of the Hexagonal chuck wrench by one hand and lock the screw with the inner hex wrench in the other hand.

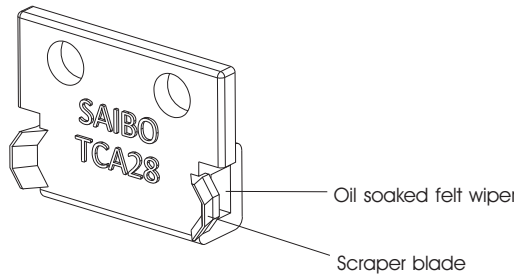
Carriage size	Locking torque (N.m)
28	7
35	7
43	12

Important Note

Appropriate pre–load performs system rigidity. However,over–preload will decrease system's life rapidly. Please be careful.

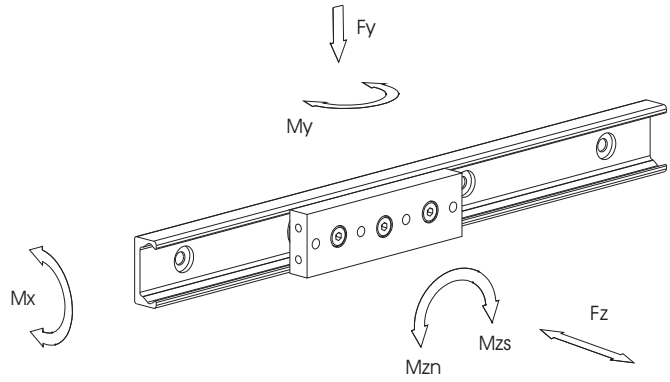
Lubricate

SAIBO Lubricate wiper designed two functions. Scraper blade is to remove the dust on the raceway. Oil soaked felts touch the raceway to lubricate it. All lubricate wiper filled oil before delivery. Please check and fill mineral base oil regularly. Change felt or lubricate wiper when felt was worn.



Load Calculation

Load capacity of the motion guide system varies mainly by the size of bearing and railway, lubricated or not, and the load magnitude and direction. Other factors include speed and acceleration and environment etc. To calculate system life, loading factor LF should be calculated firstly.



LF - Loading factor

(LF should be less than 1.0 for any combination of load)

$$LF = Fy + \left(\frac{Fz}{Cz} + \frac{Mx}{Mxmax} + \frac{My}{Mymax} + \frac{Mz}{Mzmax} \right) Cy$$

LF - Loading factor

Fy - Actual load in Y direction. (N)

Fz - Actual load in Z direction. (N)

Mx - Actual moment in X direction. (N.m)

My - Actual moment in Y direction. (N.m)

Mz - Actual moment in Z direction. (N.m)

Below parameters can be taken from the table of Load capacity.

Fy max - Max load capacity in Y direction. (N)

Fz max - Max load capacity in Z direction. (N)

Mx max - Max moment capacity in X direction. (N·m)

My max - Max moment capacity in Y direction. (N·m)

Mz max - Max moment capacity in Z direction. (N·m)

Life calculation

$$L_{km} = 100 \cdot \left(\frac{C_{100}}{LFf} \right)^3$$

C_{100} – Load coefficient

(Please see it in the table of Carriage load capacity)

f - Reduction coefficient of the application and environment.

None vibration or shock, Low speed (<1m/s), Low frequency shift direction, clean environment.	1-1.5
Light vibration or shock, medium speed (1-2.5m/s) medium frequency shift direction, some dirtiness	1.5-2
Heavy vibration or shock, high speed (>2.5m/s) high frequency shift direction, heavy dirty	2-3.5

TE Roller Type Linear Guide

Construction

The roller guide rail is composed of a C–type track and a roller slider. The slider adopts positive eccentric roller design.

Railway

Guide material: zinc–plated steel or stainless steel
Stainless steel rails have high corrosion resistance

Carriage

The slider body comes in two types: compact body or solid body.
The Rail materials used zinc–plated steel or stainless steel
The solid slider body is made of high-quality aluminum alloy, treated with oxidation.
The rollers are precision-ground ball bearings.

Feature

Anti–corrosion
Good reliability in dirty environments
Large range of work
Slider adjustment is simple

Running Parameter

Running Parameter
Max. Speed: 1.5m/s
Max. Acceleration: 2m/s^2
Operating temperature: the maximum operating temperature of the guide rail is 120℃. If you need to use in a high temperature environment, you can contact our relevant technicians

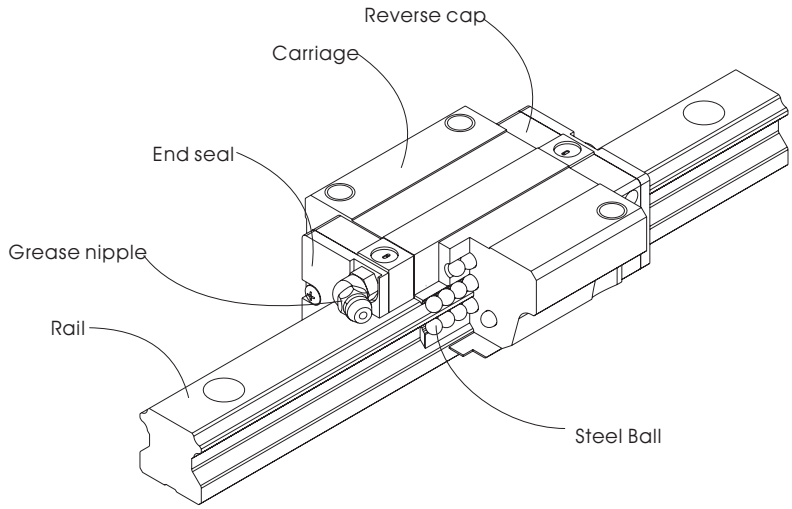
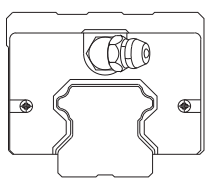
HG Steel Ball Type Linear Guide

Structure

HG linear guide is composed of a rail and carriage(s). Steel balls circulate inside the carriage through the reverse caps at both ends of the carriage. By the designing of four–row raceways, 45degrees contact angles, it has not only equal heavy load capacity in radial and axial directions with high rigidity, but also self–aligning capability to realize high accuracy and smooth operation.

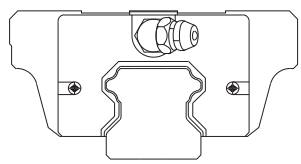


Carriage Types



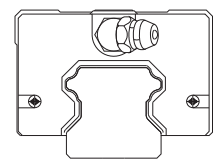
HGH

HGH Square (Higher) type carriage. This assembly height is higher than another two types. Only top mounting available.



HGW

HGW Flange type carriage. This type carriage is suitable for heavy moment load application because of lower assembly height and wider mounting surface. Top mounting and bottom amounting are available.



HGL

HGL Square (Lower) type carriage. This assembly height is same as flange type. Only top mounting available.

Preload

SAIBO offers three classes of standard preload for various applications and conditions.

Class	Code	Preload	Condition	Examples of Application
Light Preload	Z0	0—0.02C	Certain load direction. low impact. low precision required	Transportation devices, auto-packing machines. X-Y axis for general industrial machines. welding machines.
Medium Preload	ZA	0.05C—0.07C	High precision required	Machining centers. Z axis for general industrial. machines. EDM. NC lathes, Precision X-Y tables.
Heavy Preload	ZB	0.10C—0.12C	High rigidity required. with vibration and impact	Machining centers, grinding machines. NC lathes, horizontal and vertical milling machines.

Class	Interchangeable Guideway	Non-Interchangeable Guideway
Preload classes	Z0, ZA	Z0, ZA, ZB

Note: The "C" in the preload column denotes basic dynamic load rating.

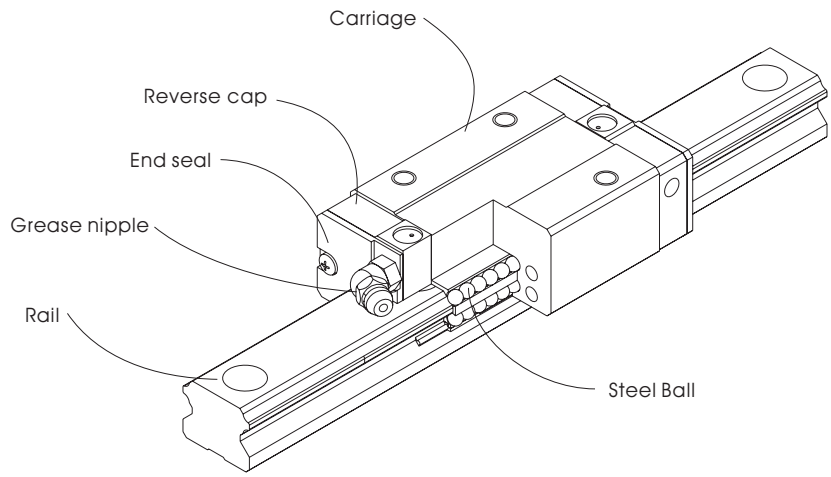
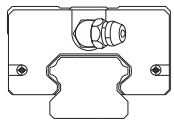
EG Steel Ball Type Linear Guide

Structure

EG linear guide structure is same as HG type. Four–row raceways, 45degrees contact angles designing. It has not only equal heavy load capacity in radial and axial directions with high rigidity, but also self–aligning capability to realize high accuracy and smooth operation. EG assembly height is lower than HG type. Heavy load and medium load carriages are designed to meet different applications.

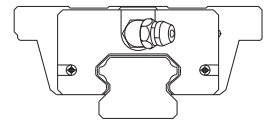


Carriage Types



EGH

EGH Square type carriage. Assembly height is lower than HGH, fit for compact space applications.



EGW

EGW Flange type carriage. Assembly height is same as EGH. This type carriage is suitable for heavy moment load application because of lower assembly height and wider mounting surface. Top mounting and bottom amounting are available.

Preload

SAIBO offers three classes of standard preload for various applications and conditions.

Class	Code	Preload	Condition
Very Light Preload	Z0	0-0.02C	Certain load direction. low impact.low precision required
Light Preload	ZA	0.03C-0.05C	Low load and High precision required
Medium Preload	ZB	0.06C-0.08C	High rigidity required. with vibration and impact

Class	Interchangeable Guideway	Non-Interchangeable Guideway
Preload classes	Z0，ZA	Z0，ZA，ZB

Note: The "C" in the preload column denotes basic dynamic load rating.

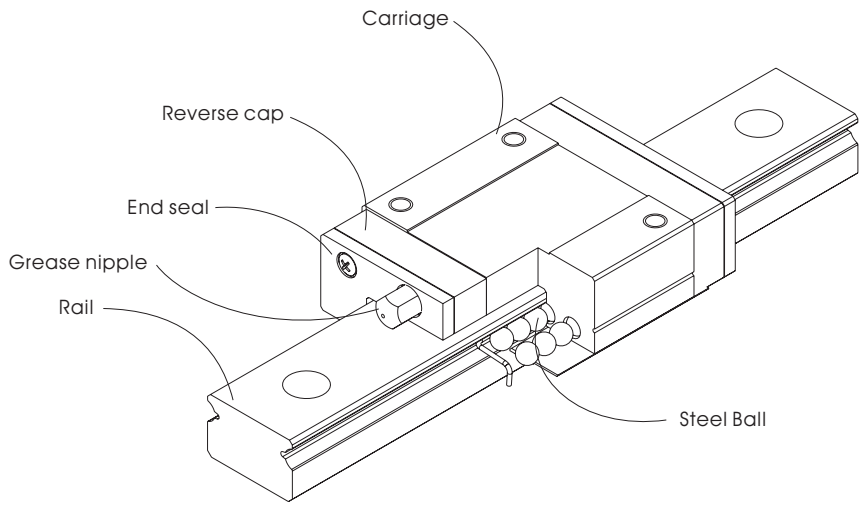
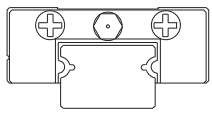
MG Steel Ball Type Linear Guide

Structure

MG miniature linear guide is designed with four–points contact structure. It not only has heavy load capacity in radial and axial directions, but also realizes with high rigidity, high accuracy and smooth operation.

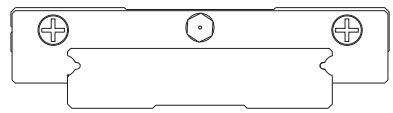


Category



MGN

MGN type rail is standard and narrow.



MGW

MGW type rail is wide. This structure improves carriages load and moment load capacity.

Preload

SAIBO offers three classes of standard preload for various applications and conditions.

Class	Code	Preload	Accuracy
Light Clearance	ZF	Clearance 4-4–10 μ m	C
Very Light Preload	Z0	0	C-P
Light Preload	Z1	0.02C	C-P

Note: The "C" in the preload column denotes basic dynamic load rating.

Model Rule

MGN 12 C E Z1 P M + U/–O — **Carriage**

- MGN/MGWSeries
- Model size 5,7,9,12,15
- Block Type C: Standard H: Long

HV Heavy Load Linear Guide

Construction

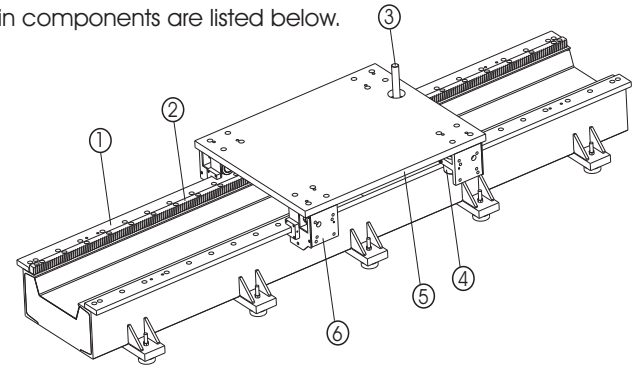
HV linear guides are designed for heavy loads. It has the characteristics of high precision, stable performance and low friction. It is mainly used in mobile platform of joint robot, flexible production line, automobile production line and so on.

Feature

1. Heavy load capacity.
2. Modular designed components are easy to build different structure.
3. Connectable railway and rack can build to long-distance.
4. Lubrication tube integrated in roller housing.

Standard system

According to load capacity, SAIBO provide 3 sizes standard systems. With these 3 sizes systems' single components, customers are easy to adjust railways' span, carriage sizes and assembly directions. System's main components are listed below.

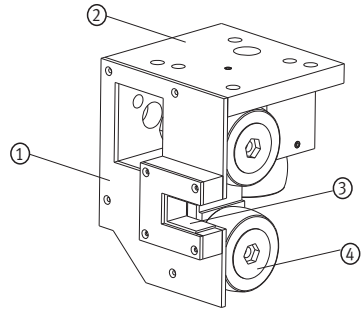


System's main components

① Railway	③ Gear	⑤ Carriage plate
② Rack	④ Roller	⑥ Roller housing

Roller housing

Roller housing is designed according to modular idea. It enables customers to adjust railways' span, carriage's sizes and assemble direction. Roller's inside and railway's wiper lubrication systems are integrated in this roller housing. After installation, customers only fix the automatic lubrication system's nozzle to the lubricate screw holes, the whole system's automatic lubrication will be working.

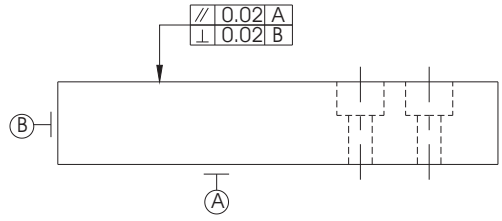


System's main components

① Wiper cover
② Roller housing
③ Felt wiper
④ Roller

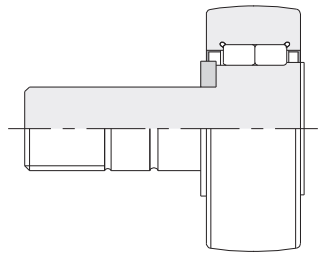
Railway

The railway is made of high carbon bearing steel DIN 100Cr6. Working surface is hardened to over 50HRC. Accuracy is as below picture. Max length is 2000mm, but it can be connected easily to any length.



Roller

Roller is precision double rows roller bearing. It is heavy duty designed and treated. Heavy duty lithium soap grease is filled inside the bearing before delivery. Roller's outer diameter surface is spherical where radius is 500mm.

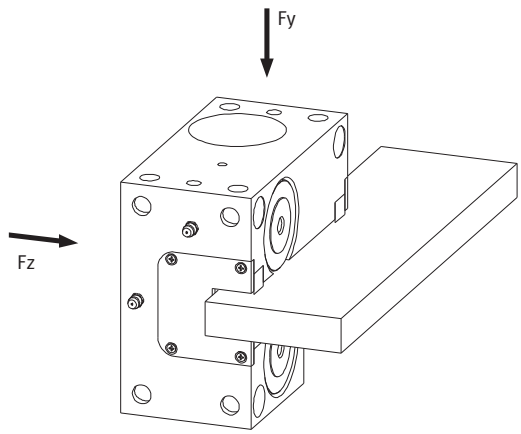


Load capacity

Roller inside is without cages and has the largest possible number of rolling elements. Therefore it has particularly high load capacity. According to designed basic life 1000km, rollers' load capacity is listed as below:

Roller size	Roller load capacity (N)	
	Dynamic	Static
62	41000	59300
72	58000	75300
90	75000	102300

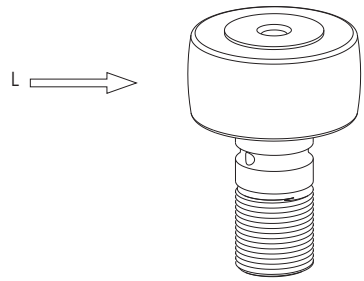
Considering fixed to the roller housing, application's shock, safety factor, each roller housing's load capacity has to be reduced to below values.



Roller size	Roller housing load capacity (N)	
	Fy	Fz
62	13000	13000
72	17000	17000
90	33000	33000

Load/life calculation

After selected system size, verification calculation is necessary. Due to the hardness of the railway and fatigue analysis of railway and roller, the railway's life does not determine the system life. It is determined by biggest loaded roller's life. The system life will be equivalent to the shortest roller's life.



$$LF = \frac{L}{Lmax}$$

(LF should be less than 1.0)

L - Actual load (N)

L max - Load capacity for basic life 1000km (N)

Roller size	L max -Load capacity for basic life 1000km (N)
62	41000
72	58000
90	75000

Then calculate roller's life by using below formula:

$$\textbf{Life(km)} = \frac{1000}{(0.03+0.97LF*f)^3}$$

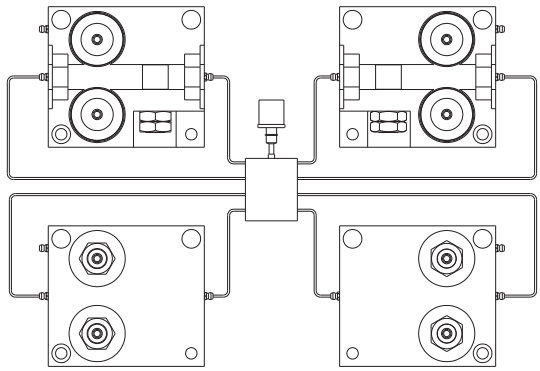
f - Reduction coefficient of the application and environment.

None vibration or shock, Low speed (<1m/s), Low frequency shift direction, clean environment.	1-1.2
Light vibration or shock, medium speed (1-2.5m/s) medium frequency shift direction, some dirtiness	1.2-5
Heavy vibration or shock, high speed (>2.5m/s) high frequency shift direction, heavy dirty	1.5-2.5

Lubrication

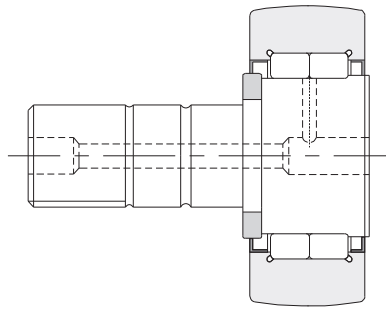
Railway

Lubrication will reduce the friction and increase system's life. Lubrication structure designed in the roller housing where oil soaked felt wipers running on the railways working surface. It should be re-lubricated each 100km running. It is easy to fill oil from the nozzle outside the roller housing. Lubricate should be mineral oil. When the felt wiper wear to a certain extent, it must be replaced. If necessory, nozzle could be connected to the automatic oiling system as below picture.



Roller

Heavy duty lithium soap grease is filled inside the bearing before delivery. We recommend re-lubricate roller after each 1000Km working. In every roller housing, all of three rollers' lubricate holes are connected to roller housing's lubricate tube. So fill grease into the nozzle outside of the roller housing, each bearing will be re-lubricated. According to grease's properties, roller can be used between -30°C and 120°C working conditions.



Gear and rack

Gear and rack must be lubricated each 100km running. We recommend high viscosity and heavy load mineral oil.
