

SNIBO
Innovation in Motion

CURVED RAIL

SAIBO is one of world recognized manufacturers of precision power transmission components. SAIBO group has two divisions, linear motion division and bearing division. Linear Product Division mainly produces curved rail and conveyor, telescopic rail and fork, linear guide, linear module, belt conveyor etc. Bearing Division mainly produces Thin-section bearing, High-speed angular contact ball bearing, linear bearing etc.

SAIBO products are widely used in 3C, factory automation, precision machine, green energy, rail transportation, medical and pharmacy etc. industries. SAIBO end users are located in more than 50 countries and regions around the world.

SAIBO has over 33,000 square meters producing facilities totally and 350 employees. SAIBO continues to develop innovative automation components and modulars to meet customers sustainable solutions.

SAIBO means aim for greatness, focus on details. We seek to work with you and promise the following:

- The right product from your application
- A quality product you can trust
- Engineering assistance that is proven and world renown

Straight Rail

Made of Germany high quality bearing steel
 Deep hardened in working surfaces for high wear resistance
 Ground Double 70° V working edges together to ensure parallelism
 Soft rail body for customization machining process
 Provide 3 standard sizes for customer's selection
 Two precision rails G1 and G3 is optional, ground and un-ground
 Precision G3 rail length could be up to 5.5 meters without connection
 Longer length (Unlimited) can be achieved by Connection

Ring Rail

Made of high quality bearing steel
 Deep hardened in working surfaces for high wear resistance
 Ground Double 70° V working edge ensure parallelism
 All surfaces are ground for precision
 Provide wide range of standard sizes
 Customized assembly holes are available

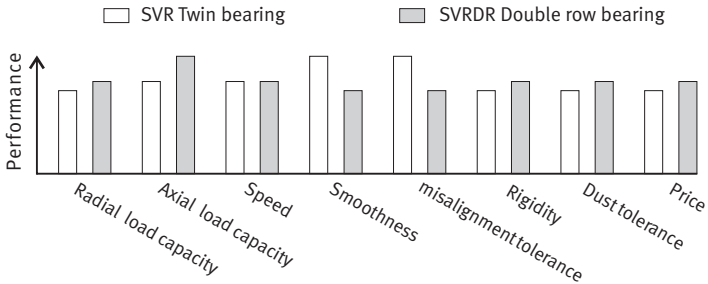

Precision

SAIBO provides two precision grades. G1 ground and G3 unground. Here we must emphasize that G3 grade's motion is also very smooth and stable. It is fit for smooth running without very high precision and low cost request. But when linear rail connect ring rail, it must be G1 grade.

Roller Made of high quality bearing steel
 Whole body hardened for high wear resistance
 Supply Twin and Double row bearings
 (See below figure)
 Concentric / Eccentric bolt supplied

Floating Bearing Outer ring could float in axial direction to compensate installation parallelism
 Made of high quality bearing steel
 Whole body hardened for high wear resistance
 Concentric / Eccentric bolt supplied

Roller Type Selection

Roller Type Selection Please refer to page P11-P12.

Cap Seal

Protect bearing against dust

Protect operator for safety

Lubricated felt wiper contact rail's working surface to increase load capacity and life

Standard and interchangeable

Lubricate Wiper

Lubricated felt wiper contact rail's working surface to increase load capacity and life

Lubricated felt wiper is pushed lightly by a small spring to ensure low friction with the rail's working surface

Easy to fill lubricate oil from its fill hole

Standard and interchangeable

Lubricate System

Lubricated felt wiper contact rail's working surface to increase load capacity and life

Lubricated felt wiper is pushed lightly by a small spring to ensure low friction with the rail's working surface

Oil charging holes supplied for the Track Motion System

Automatic lubricate bleed could connect to the rail's oil charging holes very easily.

Standard and interchangeable

Assembly manual

1. Match rollers to carriage plate

Please mount the concentric bearing to one side of carriage plate, and eccentric bearing to the other side following the direction of railway. In case of circle motion carriage, the concentric bearing should be mounted to the side where mounting-hole distance is shorter. Please refer to below picture.

Circle motion carriage plate

2. Mounting to railway

Carriage assembly should be mounted from the end of railway. Please do not put any overstress when mounting.

3. Adjust the clearance between bearing and railway

- Tighten concentric bearings first.
- Then rotate eccentric bearing via rotate hexagonal key at the end of stud to adjust the clearance between railway and bearing.
- Adjust the clearance to zero.
- Slide the carriage by hand and adjust to the extent where there causes a slight slipping resistance.

Correct condition is where moving power becomes the recommended value as below table by putting load by push-pull gauge to the running direction of carriage.

Recommended pre-load by push-pull gauge

V track bearing size	Pre-load(N)
25	4
44	8
76	12

-Keep eccentric bearing's position and tighten the nut.

Important note

Appropriate pre-load provide the system rigidity. However, over preload will decrease system's life rapidly. Please be careful.

Load / Life calculation

Due to the hardness of the railway and fatigue analysis of railway and roller, the railway's life does not determine the system life. It is determined by roller's life. Load capacity of the motion guide system varies mainly by the size of bearing and railway, lubricated or not, and the load magnitude and direction. Other factors include speed and acceleration and environment etc. To calculate system life, loading factor LF should be calculated firstly. Here we provide two methods to calculate the loading factor.

Standard 4 bearings carriage calculation

If the system use SAIBO standard 4 bearings carriage, then calculation can use below formula.

$$LF = \frac{F_y}{F_{y\max}} + \frac{F_z}{F_{z\max}} + \frac{M_x}{M_{x\max}} + \frac{M_y}{M_{y\max}} + \frac{M_z}{M_{z\max}}$$

F_y - Actual load in Y direction. (N)

F_z - Actual load in Z direction. (N)

M_x - Actual moment in X direction. (N·m)

M_y - Actual moment in Y direction. (N·m)

M_z - Actual moment in Z direction. (N·m)

Below parameters can be taken from the table of Load capacity.

F_{y max} - Max load capacity in Y direction. (N)

F_{z max} - Max load capacity in Z direction. (N)

M_{x max} - Max moment capacity in X direction. (N·m)

M_{y max} - Max moment capacity in Y direction. (N·m)

M_{z max} - Max moment capacity in Z direction. (N·m)

Roller load factor

If the system does not use SAIBO standard 4 roller carriage, It is necessary to calculate each roller's loading factor. Biggest loaded roller's load determines the system's life.

$$LF = \frac{F_y}{F_{y\max}} + \frac{F_z}{F_{z\max}}$$

LF - Loading factor

LF should be less than 1.0 for any combination of load

F_y - Actual axial capacity. (N)

F_z - Actual radial capacity. (N)

Below parameters can be taken from below table.

F_{y max} - Max axial load. (N)

F_{z max} - Max radial load. (N)

Roller's load capacity Please refer to page 11.

Life calculation After getting Loading Factor LF, the life in km can be calculated by selecting one of below two formulas. The basic life can be taken from table below.

Dry system

$$\text{Life(km)} = \frac{\text{Basic_life}}{(0.03+0.97LF*f)^2}$$

Lubricated system

$$\text{Life(km)} = \frac{\text{Basic_life}}{(0.03+0.97LF*f)^3}$$

Basic life

Bearing type	Dry system	Lubricated system
SVR-25	100	150
SVR-34	100	150
SVR-54	150	250

f - Reduction coefficient of the application and environment.

None vibration or shock, Low speed (<1m/s), Low frequency shift direction, clean environment.	1-1.5
Light vibration or shock, medium speed (1-2.5m/s) medium frequency shift direction, some dirtiness	1.5-2
Heavy vibration or shock, high speed (>2.5m/s) high frequency shift direction, heavy dirty	2-3.5

Calculation example

A machine use SB-LGV25 spacer railway and standard carriage. The carriage and work-piece total weight 8 kg. When the carriage moving, there is an external load of 50 N exerted as below drawing. Working environment is clean. There is none vibration or shock.

**The load factor LF is
calculated use formula**

$$LF = \frac{F_y}{F_{y\max}} + \frac{F_z}{F_{z\max}} + \frac{M_x}{M_{x\max}} + \frac{M_y}{M_{y\max}} + \frac{M_z}{M_{z\max}}$$

$$F_y = 8\text{kg} \times 9.8 \text{ (gravity)} = 78.40 \text{ N}$$

$$F_z = 50 \text{ N}$$

$$M_x = 50 \times 0.05 = 2.5 \text{ N}\cdot\text{m}$$

$$M_y = 0$$

$$M_z = 0$$

Take parameters $F_y \max$, $F_z \max$, $M_x \max$, $M_y \max$, $M_z \max$ from table and then fill in the formula

$$LF = \frac{78.4}{1280} + \frac{50}{1200} + \frac{2.5}{14} + \frac{0}{M_{y\max}} + \frac{0}{M_{z\max}} = 0.2816$$

Then life (km) calculation can use formula as below:

Dry system

$$\text{Life(km)} = \frac{\text{Basic_life}}{(0.03+0.97LF*f)^2}$$

Basic life is 100km.

According to the description of working condition, take $f=1.3$.

$$\text{Life(km)} = \frac{100}{(0.03+0.97*0.2816*1.3)^2} = 674\text{km}$$

Lubricated system

Basic life is 150 km, take $f=1.1$

$$\text{Life(km)} = \frac{\text{Basic_life}}{(0.03+0.97LF*f)^3}$$

$$\text{Life(km)} = \frac{150}{(0.03+0.97*0.2816*1.1)^3} = 4155\text{km}$$

From this example, it shows clearly that lubrication is so important for the life. Please pay attention to install the lubrication system for your system.

Oval Circular Conveyor

SAIBO curve and ring rails' main application is oval circular conveyor module which is driven by timing belt. SAIBO has standardized these conveyors to a series of modules. The module has following advantages: simple structure, Stable and reliable performance, high speed, high positioning accuracy etc.

Main components are linear and ring rails, carriage with rollers, teeth belt and pulleys, connection parts between teeth belt and carriages, position device etc.

Indexing Conveyor

- All parts designed standard
- Supply individual components
- Stainless steel components are available

Convey Capacity

Single carriage's load capacity and running speed are two most important indicators of conveyor capacity. Normally the greater load on the carriage, the smaller speed it runs.

According to ring rail's diameter, there are four standard size circular conveyor modules. They are D255, D351, D468 and D612. Below chart shows the reference between carriage's load capacity and speed in the condition of horizontal installation.

The reference between carriage's load capacity and speed

Above chart data is tested in the conditions of

1. Conveyor is installed horizontal and the rail is in well lubricated.
2. Load gravity center is located at the center of the carriage meanwhile the load does not exceed carriage's space.
3. Appropriate temperature and humidity, clean working condition.

Carriage's quantity is another one of important influence factors of convey capacity. Long rails with a big number of carriages will make single carriage's load capacity smaller at a constant driving force. Please contact us when need those special applications. We provide professional solutions.

Recommend Load

Size	Recommend Load		Max Load	
	Load for Single Carriage (Kg)	Speed (m/s)	Load for Single Carriage (Kg)	Speed (m/s)
D255	3	0.4	6	0.1
D351	5	0.5	12	0.1
D468	10	0.5	20	0.1
D612	10	0.5	20	0.2

Stability and Reliability

1. Based on the design criteria of this ring rail, one of rollers will develop a small clearance momentarily when carriage running across the joint of straight rail and ring rail. This frequent on-and-off clearance is a small shock for this conveyor. We optimize the parameter to reduce the clearance value and then reduce the shock. But it could not completely eliminate.

2. High speed, big load or big arm of the force will enlarge above shock.

Strongly Recommend

We strongly recommend size D351 and D612 modules. Because these two size rails momentarily clearances are smaller than other sizes. Furthermore our numerous applications proved these two size conveyors are most stable and reliable.

Conveyor Parameter

MOV25-D255R180-L-CA □

Ring Rail Diameter $\varnothing D$	A	B	H1	H2	$\varnothing d$	h
$\varnothing 255$	100	80	130.5	67	25	39.9

1. Circular Rail Type Number: LGV44XL-CR44 612 R180
Carriage Type Number: SRC44 612
2. Carriages' distance C could be customized set. We suggest $C \geq 180$ when position locking system applied.
3. Linear rail length L should be determined by carriage's number and distance.

Vertical Conveyor

According to load and torque, single or double guide rail are available. The double guide rail conveyor is suitable for applications with heavy load and high torque. This double guide rail conveyor can also be used horizontally and can bear large loads on the side. The characteristic is stable and reliable.

Rectangle Conveyor

This conveyor has four straight line that can be used as production stations. More actuators, robots and the other devices can be configured along with the straight line flexibly. straight line length can be extended infinitely.

Vertical Conveyor with Two Parallel Curved Rail

This conveyor is configured with two circular guide rails, one rail uses fixed rollers and the other uses floating rollers. The distance between two rails can be set a larger distance, it is suitable for transmitting workpieces or tooling with a large length.
