

SAIBO
Innovation in Motion

LINEAR BEARING

SAIBO is one of world recognized manufacturers of precision power transmission components. SAIBO group has two divisions, bearing division and linear motion division.

SAIBO Bearing Division produce precision deep groove ball bearing, high speed angular contact ball bearing, thin section bearing and linear bearing etc. Mainly supplies for the manufactures of automobile, household appliances, motors, machine tools, automation equipment and other industries. Our 60% sales are exported to European, North American and Asian markets.

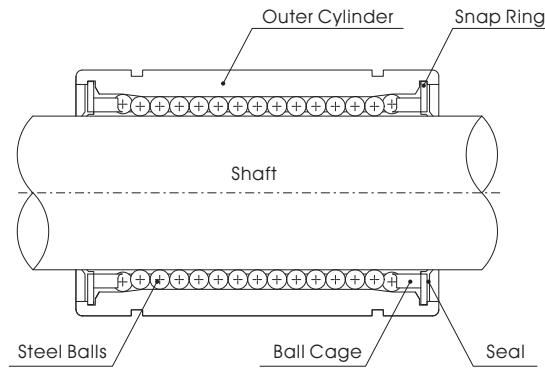

SAIBO has over 33,000 square meters producing facilities totally and 350 employees with annual production capacity of 35 million bearings. SAIBO has all kinds of testing instruments, including metallographic microscope, video measuring instrument, steel ball vibration measuring instrument, roundness instrument, roughness instrument, groove curvature instrument, length measuring instrument, three coordinate measuring instrument, life testing instrument, velocity and acceleration type vibration measuring instrument. All of these provide an effective guarantee for producing high quality products.

SAIBO means aim for greatness, focus on details. We seek to work with you and promise the following:

- The right product from your application
- A quality product you can trust
- Engineering assistance that is proven and world renown

Linear Bearing / Linear Bushing

SAIBO Linear Bearing / Linear bushing is the simplest and most economic elements for linear motion. It consists of an outer cylinder, a ball cage, steel balls and seals etc. Linear bearing can be used in a wide variety of applications such as automation equipment, food and package equipment, semiconductor and electronic equipment, transportation equipment.

1. Features

Compact structure

Linear bearing's motion is very simple. Linear bearing moves on a round linear shaft. This enable its mechanism structure to be very compact.

Accuracy and Rigidity

Raceway, steel ball and linear shaft are all hardened, with proper tolerance fit, linear bearing's motion have the characteristics of high precision and high rigidity.

Low friction and quiet

The raceway surface is ground precisely. The contact surface between balls and raceway is minimize-designed. So friction is very small. Running is quiet.

Standard size and interchangeable

All SAIBO linear bearings are designed with international standard. By strict accuracy control, all linear bearings are interchangeable

Variety of type

To meet different applications, SAIBO produces a full of types including standard type, clearance adjustable type, open type, flange type and double-length type etc. Furthermore imperial size products are available.

2. Basic rated static load and safety factor

When a bearing subject to an excessive load or a strong impact load, the bearing may incur a local permanent deformation of the rolling elements and raceway surface if the elastic limit is exceeded. The nonelastic deformation increases in area and depth as the load increases, and when the load exceeds a certain limit, the smooth running of the bearing is impeded. The basic rated static load refers to the static load capacity by the bearing when the total permanent deformation of 0.0001 times the diameter of the rolling body occurs in the center of the contact surface between the rolling body and the raceway.

The safety factor refers to the ratio of the basic rated static load to the equivalent static load. Higher factor indicate more security. In preliminary selection, if the bearing only subjects to radial load, the equivalent static load can be replaced by radial load. The safety factor is equal to the ratio of the radial basic rated static load to the radial load. The selection of the safety factor can refer to below table

Table 2.1 Safety factor (fs)

Application	Load condition	Min. fs
General Industry machine	None vibration or shock	1.0~1.3
	Vibration or/and shock	2.0~3.0
Machine tool	None vibration or shock	1.0~1.5
	Vibration or/and shock	2.5~7.0

3. Basic dynamic load rating and rated life

The rated life can be calculated according to below formula:

$$L = \left(\frac{C}{P} \right)^3 \times 50$$

L: Rated life (km)

C: Basic static load rating (N)

P: Actual load (N)

Under actual working conditions, various factors will affect the service life of the bearing, which needs to be calculated through the correction coefficient. Please see below formula. Each correction factor can be selected from the charts.

$$L = \left(\frac{f_H \times f_T \times f_C}{f_w} \times \frac{C}{P} \right)^3 \times 50$$

L: Rated life (km)

f_T: Temperature factor (Chart 3.2)

C: Basic dynamic load rating (N)

f_C: Contact factor (Table 3.1)

P: Actual load (N)

f_w: Load factor (Table 3.2)

f_H: Hardness factor (Chart 3.1)

Hardness factor f_H

In order to achieve the best bearing capacity of the linear bearing, the hardness of the matching shaft should reach 58-62HRC. If the hardness of the shaft decreases, the load capacity of the system also decreases. Please refer to below chart:

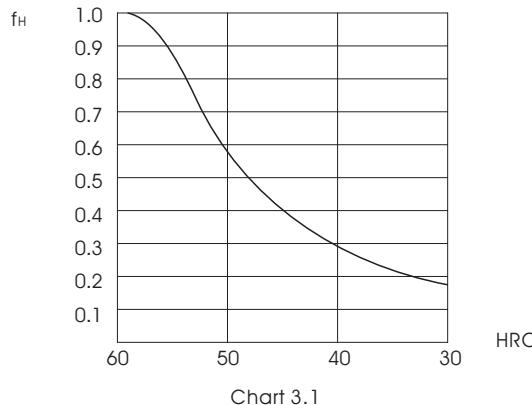

Chart 3.1

Temperature factor f_T

The normal working temperature of the linear bearing is in the range of -20°C to 80°C. When it exceeds 80°C, the seal and cage must be replaced with high temperature-resistant types. If the working temperature is higher than 100°C, it is necessary to consider the influence of temperature on the performance of the product material. Please refer to below chart.

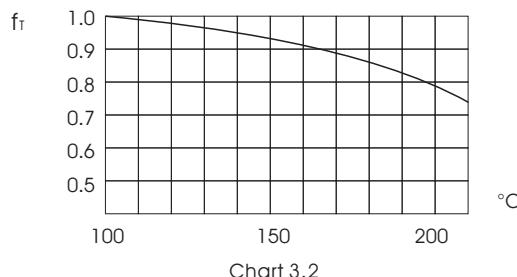

Chart 3.2

Contact factor f_C

When multiple linear bearings are used on one shaft, it is difficult to achieve consistent load distribution for each linear bearing due to assembly accuracy. The life of the most loaded linear bearing will be reduced, and therefore the life of the entire system will also be reduced. The contact coefficients in the table below can be used for calculation. When installing multiple bearings on one shaft, it is better to enlarge the difference between each bearing.

Number of linear bushings on a shaft	
2	0.81
3	0.72
4	0.66
5	0.61
Over 6	0.6
In normal use	1.0

Table 3.1

Load factor f_w

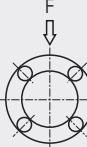

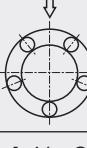

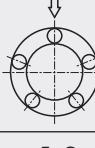

Shock, vibration, and high-frequency start-stop will also affect the service life. Please refer to below table.

Working condition		f_w
Loading	Speed	
None vibration or shock	15m/min under	1.0~1.5
Slight vibration or/and shock	60m/min under	1.5~2.0
Strong vibration or/and shock	60m/min over	2.0~4.0

Table 3.2

4. Load capacity and steel ball distribution

If linear bearing inside steel balls are symmetrically distributed relative to the load, the loading capacity of the linear bearing will be improved, and the service life will also be increased. Please refer to below

Number of Ball rows	Position	
	Max. Load	Min. Load
4		
	$F=1.41 \times C$	$F=C$
5		
	$F=1.46 \times C$	$F=C$
6		
	$F=1.26 \times C$	$F=C$

C: Basic Dynamic rating

Chart 4.1

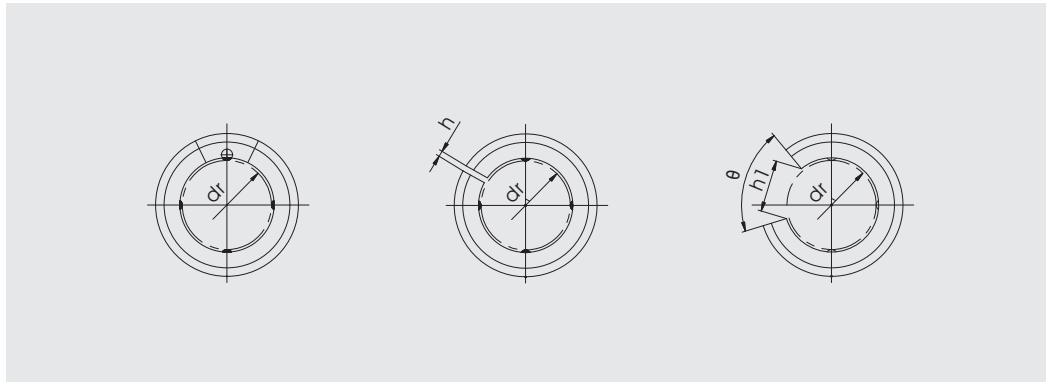

5. Lubrication

Linear bearings are treated with anti-rust oil before packing. Lubricants need to be filled in the linear bearing when application. Before fill grease, it needs to remove anti-rust oil with kerosene or another organic solvent, then dry the linear bearing. It is better to fill the grease directly onto the steel balls inside.

Self-lubricate Linear Bearing

SAIBO self-lubricate linear bearings' application includes a wide range of industries, such as medical equipment, food and package equipment, fitness equipment and precision punch machine.

Structure

1. Bearing body: Colored anodized aluminum alloy
2. Bonding agent: Excellent bonding performance, resist high temperature.
3. Friction material: PTFE and filled anti-friction material

PTFE features

PTFE's excellent physical and chemical performance have been approved after several decades' application. In linear motion, SAIBO selects PTFE to be friction material according to below advantages.

- Self-lubricate
- Resist high and low temperature (-240°C ~ +260°C)
- Soft and can absorb vibration
- Non-toxic and harmless to the human body.

Friction material feature

After many years' research and explore, SAIBO develops this mixed friction material's performance and quality to the top in the world. PTFE and its mixture have below features:

- Anti-friction
- Good load capacity
- Excellent bonding performance with PTFE

Advantage

Here we compare SAIBO self-lubricate linear bearing with traditional steel ball linear bearing.

	SAIBO Self-lubricate linear bearing	Steel ball linear bearing
Load capacity	4-20 times load capacity than steel ball linear bearing	Fit for light load
Speed	Low and middle speed	Middle and high speed
Friction Coefficient	0.03-0.20	0.002-0.003
Noise	Quiet	Big noise
Lubrication	Without	Necessary
Anti-Corrosion	Good	None
Anti-vibration and shock	Good	None
Interchangeability	Good	Good
Running ways	Linear, Rotary or combination	Only linear
Acceptable shaft	harden or soft shaft	harden shaft
Machining	Hole can be machined	Can not

PV character

The Pressure Velocity (PV) factor is a key parameter during design and selection of SAIBO self-lubricate linear bearing. PV can define the friction performance between system's pressure and velocity. PTFE's mixture has an intrinsic limiting PV rating while the system running under certain conditions. Put simply, the more load applied to system, the slower it must move to avoid exceeding PV limit. The reverse is also true, more speed, less available load capacity. Overload and exceeding Max speed will cause frictional heat and accelerate wear.

Max PV value: 0.7 N/mm² × m/s

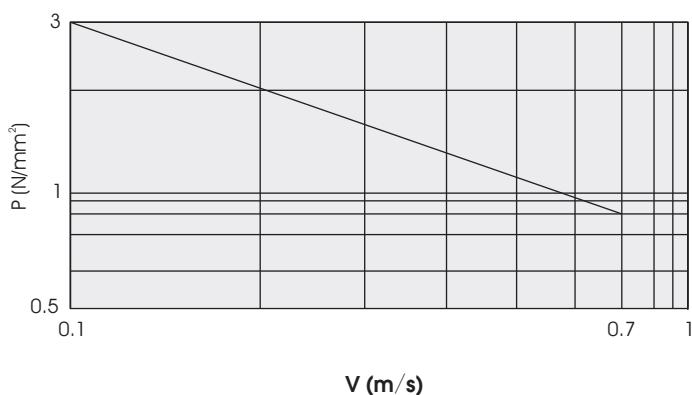

Load capacity: 20 N/ mm² (MPa)

Max speed: 1.5m/s

Working temperature: -50°C ~ +260°C

Friction Coefficient: 0.03~0.2

Blow table shows SAIBO self-lubricate linear bearing PV limit at 20°C working conditions.

Lubrication

PTFE and its mixture have self-lubricate character. This is its main application reason where application's environment request without additional oil. But if conditions permit, full lubrication can reduce friction at least 30%. This is very helpful for extending bearing's life.

Recommended lubricate: Petroleum base oil or grease

Note: PTFE lubrication is forbidden.

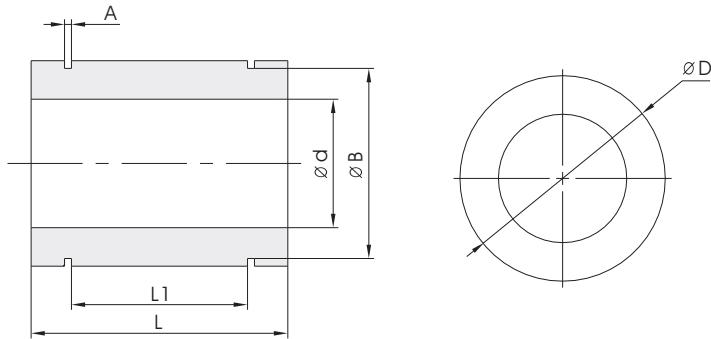

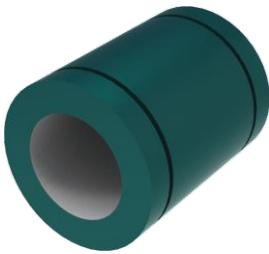

Acceptable shaft

SAIBO Self-lubricate linear bearing's acceptable conditions are not captious to shaft. But considering wear rate, we recommend the best shaft's performance as below:

Surface roughness: Ra 0.4

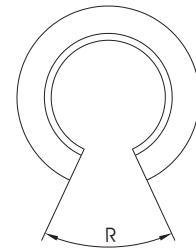

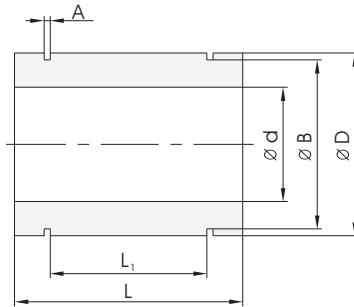

Hardness: 55HRC

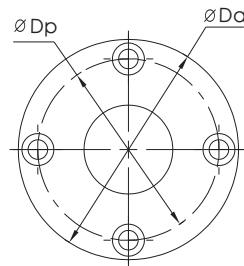

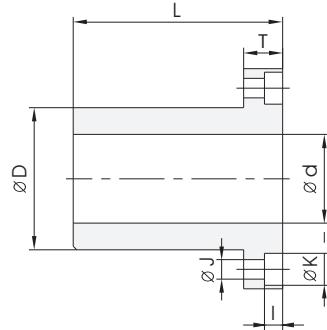

Standard type

Type	Dimension						Load capacity (N)
	d	D	L	A	B	L1
